

MIGRATION BLUEPRINT

When readiness becomes a migration planning problem.

Blueprint extends the Professional Assessment into scoped waves, validation gates, rollback expectations, remediation priorities and technical review language.

Why Blueprint exists

PLANNING LAYER

A report can reveal risk. A blueprint helps organize the response.

When the VMware exit is already real, stakeholders need a practical migration plan structure rather than only readiness findings.

ASSESSMENT

Before Blueprint

The team understands current blockers, unknowns and likely target-fit constraints.

PLAN

With Blueprint

The team receives wave framing, validation gates and rollback language for planning discussions.

Integrity boundaries

- No production write access
- No agent installation requirement
- No automated migration execution
- No zero downtime promise
- No dependency claims without evidence

What Blueprint adds

SCOPE

From evidence-backed findings to migration planning structure.

Blueprint is scoped work. It is not a fixed automation package, and it does not replace implementation engineering.

BLUEPRINT

Wave plan

Candidate waves grouped by risk, dependencies, ownership and validation needs.

BLUEPRINT

Pilot framing

Early candidates and conditions that make pilots safer to attempt.

BLUEPRINT

Rollback assumptions

Rollback expectations and evidence gaps that need attention before execution.

BLUEPRINT

Technical review

Senior review language for architecture and stakeholder alignment.

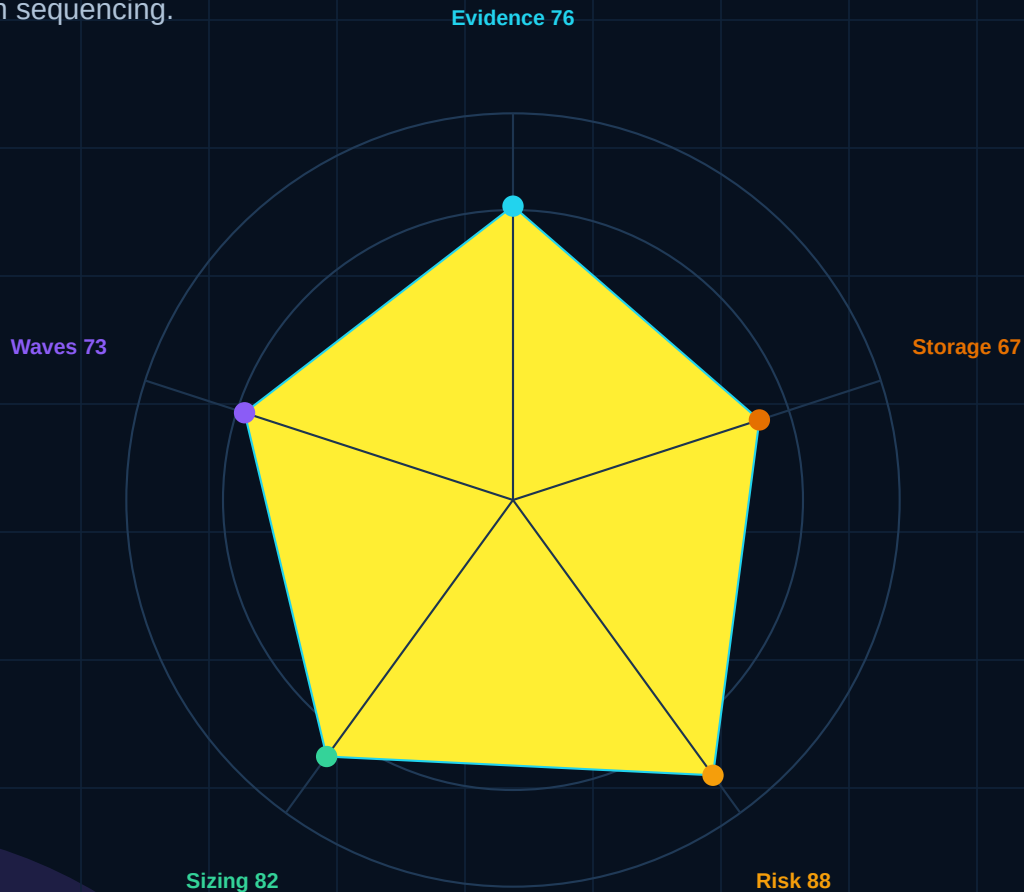

Blueprint visual spine

MODEL

A structured spine for conversations that otherwise become chaotic.

The overview below shows how the planning layer connects scored evidence, target readiness and implementation sequencing.

The radar is illustrative: real values depend on uploaded evidence, target assumptions and missing validation.

When to request Blueprint

DECISION TRIGGER

Request Blueprint when the migration decision is active, not hypothetical.

Use it when leadership, engineering and delivery teams need a shared plan structure before execution work begins.

- There is executive pressure to exit VMware, but the technical path is not yet validated.
- The team needs migration waves rather than only a readiness score.
- Storage target choices, rollback assumptions or backup evidence need explicit planning language.
- An MSP or consulting team needs a client-ready migration workshop artifact.

COMMERCIAL

Pricing

Blueprint engagements start from USD 3,500. Scope is confirmed before payment so the plan matches the real engagement depth.

What Blueprint does not promise

INTEGRITY

Clear boundaries protect the buyer and the delivery team.

Blueprint is a planning artifact, not an implementation guarantee. It supports better decisions before migration execution.

Integrity boundaries

- No production write access
- No agent installation requirement
- No automated migration execution
- No zero downtime promise
- No dependency claims without evidence

BOUNDARY

No production execution

Blueprint does not move workloads, modify clusters or operate cutovers.

EVIDENCE

No invented certainty

Unknowns stay visible until evidence is provided or validated.

Next step

MOVE FORWARD

Use Blueprint after the evidence says planning depth is justified.

Start with a Professional Assessment or discuss scope directly when the business case and migration pressure are already clear.

STARTER READINESS

USD 490

First evidence checkpoint

PROFESSIONAL ASSESSMENT

USD 1,500

Decision pack and risk matrix

MIGRATION BLUEPRINT

From USD 3,500

Waves, gates and rollback framing

MSP PARTNER

From USD 799/month

Reusable client-ready workflow

ACTION

Request scope discussion
