

VMWARE TO PROXMOX

From exported evidence to migration decisions.

A productized readiness system for teams that need risk, cost exposure, storage destination suitability and migration planning signals before committing to execution.

The transition challenge

WHY IT EXISTS

VMware exits fail when teams migrate inventory instead of risk.

Broadcom licensing pressure can create urgency, but a rushed hypervisor transition can amplify hidden storage, network, backup and application dependency problems.

BROADCOM PRESSURE

Commercial trigger

Licensing pressure changes timing, not engineering reality. A financial event still needs technical qualification.

STORAGE

Storage blind spots

RVTools can show allocations, but target fit needs datastore, performance and destination storage context.

DEPENDENCIES

Transformation blockers

Unsupported VM flags, nested network patterns and backup gaps can block early migration waves.

INTEGRITY

Advisor guardrails

If evidence is missing, confidence drops. The system surfaces the gap instead of inventing certainty.

Integrity boundaries

- No production write access
- No agent installation requirement
- No automated migration execution
- No zero downtime promise
- No dependency claims without evidence

What Shift Evidence does

DECISION ENGINE

A readiness layer between raw exports and migration action.

Shift Evidence does not move VMs. It translates exported metadata and guided context into a practical decision pack for executives, engineers and MSP workshops.

How the assessment lifecycle works

LIFECYCLE

A structured path from data upload to audit-ready decisions.

The workflow keeps consulting judgment, infrastructure evidence and AI assistance separated enough to remain reviewable.

What the decision pack includes

OUTPUTS

Executive clarity and technical substance in one package.

Deliverables are designed to support budget, risk, architecture and migration sequencing conversations.

DELIVERABLE

Readiness Score

Standardized compatibility ranking and confidence posture.

DELIVERABLE

VM Risk Matrix

VM-by-VM classification for early candidates and blockers.

DELIVERABLE

Storage Suitability

ZFS, NFS, SAN or Ceph target-fit cautions.

DELIVERABLE

Missing Evidence

Validation tasks where confidence needs more proof.

DELIVERABLE

Migration Waves

Staged guidance when Blueprint scope is selected.

DELIVERABLE

Boardroom PDF

Executive and technical narrative for sign-off.

Evidence model and advisor boundaries

EVIDENCE FIRST

AI is used after structured infrastructure evidence is evaluated.

The advisor layer explains scored findings, but it stays anchored to approved assumptions and validated inputs. Missing inputs remain visible.

INPUT

Raw evidence

RVTools baseline, VM flags, snapshots, datastore signals and export metadata.

SENIOR CONTEXT

Guided context

Target hypervisor plans, storage preference, constraints, ownership and project timing.

TAM

Methodology model

Compute, licensing, storage, continuity and migration sequencing rules.

AI

Bounded advisor

Explains evidence and uncertainty. It does not replace engineering sign-off.

Integrity boundaries

- No production write access
- No agent installation requirement
- No automated migration execution
- No zero downtime promise
- No dependency claims without evidence

Scoring and decision model

DECISION MODEL

Scores are confidence tools, not magic absolutes.

Readiness depends on compatibility, missing evidence, target constraints and operational risk.
Confidence falls when critical evidence is absent.

SCORE

Readiness

How well the known estate maps to the target plan.

EVIDENCE

Confidence

How much the result depends on verified versus assumed evidence.

RISK

Blockers

Items that should be validated or remediated before early waves.

Packages and pricing truth

COMMERCIAL MODEL

Start small, escalate only when the evidence justifies depth.

Pricing is kept explicit so stakeholders understand whether they are buying a checkpoint, a decision pack, a scoped blueprint or a partner workflow.

STARTER READINESS

USD 490

First evidence checkpoint

PROFESSIONAL ASSESSMENT

USD 1,500

Decision pack and risk matrix

MIGRATION BLUEPRINT

From USD 3,500

Waves, gates and rollback framing

MSP PARTNER

From USD 799/month

Reusable client-ready workflow

Payment and fulfillment notes

- Manual invoice and controlled onboarding are the default business paths.
- Card checkout is controlled and can be enabled only after approval.
- Blueprint engagements are scoped before payment.

Security, trust and fit

TRUST MODEL

Designed for offline, pre-flight assessment work.

Shift Evidence is built for evidence review before production migration execution begins. It does not request production credentials for the marketing PDF workflow.

SECURITY

Security posture

Agentless intake and read-only evidence handling reduce production exposure.

AUDIENCE

Best-fit teams

Infrastructure leads, MSPs, consultants and executives planning a VMware exit.

BOUNDARY

Not a migration tool

It does not orchestrate VM moves, conversions, cutovers or production writes.

GOVERNANCE

Not a black box

Findings remain connected to evidence, assumptions and missing validation.

Next steps

[USE THIS BROCHURE](#)

Share the product overview before committing to a migration path.

The best next step is to inspect the public sample report, explore the synthetic demo workspace, or start a readiness assessment with exported evidence.
